

Data Center Transaction Readiness Toolkit

Turning structured client intake into transaction-ready intelligence

PORTFOLIO PROJECT BRIEF

A modular analytics system for data center occupiers, developers, brokers, and investors. It converts a structured client intake workbook into a repeatable readiness assessment, deterministic recommendations, executive deliverables, BI exports, and a curated client package.

PROBLEM

Large-scale data center requirements are often evaluated through scattered spreadsheets, subjective judgment, and incomplete project information. Before external engagement, teams need a repeatable way to identify readiness gaps and blockers.

- Is the requirement sufficiently defined?
- Are critical gaps unresolved?
- Which categories block transaction readiness?
- Is the project ready for external engagement?

END-TO-END WORKFLOW

WHY IT MATTERS

This is not just a dashboard. It creates a bridge between client intake, trusted metrics, and decision-ready outputs.

- **Repeatable:** Every project follows the same analytical structure.
- **Transparent:** Gaps and blockers are visible before engagement.
- **Scalable:** Standardized outputs support brokers and analysts.
- **Actionable:** Recommendations map directly to measured gaps.

Consulting wedge: help data center teams determine whether a project is actually ready to transact.

WHAT THE TOOLKIT PRODUCES

Executive report
Client-facing HTML + PDF brief.

Readiness dashboard
Offline HTML + PDF visuals.

Power BI handoff
Six flat CSV exports.

Delivery metadata
Manifest + package folder.

READINESS METRICS

Metric	Meaning
Readiness Completion %	Share of requirements complete or closed.
Total Requirement Count	Readiness requirements in scope.
Open Gap Count	Requirements that remain unresolved.
Critical Item Count	Items marked critical to readiness.

TECHNICAL PROOF POINTS

- Python 3.12 modular CLI architecture
- Seven installable packages
- YAML-driven metrics + schemas
- DuckDB analytics store
- HTML/PDF reports and dashboards
- Power BI export contract
- Artifact manifest + client package
- Cold-start reproducible GitHub demo
- GitHub Actions CI validation
- 300+ automated tests

Differentiator: one cold-start reproducible workflow from intake workbook to client delivery package.
